

B-Net mobile

Mobile time and performance recording

B-Net mobile features

This solution allows integrating sales representatives into the company processes. Use current information about working hours and services rendered.

B-Net mobile HR

Companies with sales representatives require a high level of flexibility, reliability and transparency for the efficient handling of mobile business processes. With B-Net mobile HR, Kaba has developed a mobile time and performance collection solution, which covers these requirements exactly. By carrying out the time recording via cellular phone, BlackBerry® device or PDA, every booking can be done exactly where and when it is due. This solution is compatible to all time recording systems that are supported by our time recording terminals. Therefore, it can be integrated easily in new or existing systems.

This new real-time solution provides the maximum convenience and flexibility to your sales representatives: Start and end of the business-related activities can be booked by the employees electronically via mobile devices directly on site. Apart from IN/OUT and OUT with reason (service type, doctor, flextime, vacation), an information function is provided.

The employees can get information about their time balances and leave days. Bookings are also possible without signal from the network. As soon as the connection to the relevant network operator has been reestablished, the data are immediately transmitted to a central database and can be processed by the company.

The use of the new solution B-Net mobile HR provides numerous advantages to companies with sales representatives, service technicians or nursing personnel: Speed, transparency, time savings and thus cost reductions. The real-time infrastructure of the solution makes the data immediately available and editable for further analyses and control of the employees.

B-Net mobile AC

B-Net mobile AC is the ideal mobile software solution in order to check access authorizations on site. It is easy to use, not localized and usable in completely flexible manner. The solution is perfectly suitable for areas in which the accesses must be controlled short-time and in a mobile way.

Apart from the PIN entry, the check or data recording can also be done by means of the LEGIC reader and barcode scanner. Due to the compatibility with these systems, there are no restrictions considering the use of it.

Checking time recordings and access authorizations on site via cellular phone, BlackBerry® device or industry PDA - every booking can be done exactly where and when it is due.
